

CLAIMS:

We claim:

1. A system for port and protocol sharing comprising:
 - a layered hierarchy of application processes and protocols;
 - an interlayer communications process disposed between each layer in said layered hierarchy; and,
 - a communications layer programmed to moderate access by all of said application processes and protocols in said layered hierarchy to a single logical port.
2. The system of claim 1, wherein each said interlayer communications process comprises:
 - a list of application process and protocols coupled to said interlayer communications process at a next higher level in said hierarchy; and,
 - at least one discrimination process programmed to select a particular one of said application process and protocols in said list to which to route selected incoming traffic.
3. The system of claim 1, wherein said communications layer comprises a process programmed to map incoming traffic in said single logical port to selected ones of said application process and protocols.
4. The system of claim 2, wherein said at least one discrimination process comprises at least one selectable discrimination algorithm based upon at least one attribute associated with at least one of said application processes and protocols.

5. The system of claim 4, wherein said at least one attribute comprises an attribute selected from the group consisting of a number of layers of application processes and protocols disposed within said hierarchy above said interlayer communications process, a weighting of said application processes and protocols in said list; a catch-all to handle applications and protocols in said list which are not selective in nature, previous context characteristics for said applications and protocols in said list, and overall system characteristics.

6. The system of claim 2, wherein said at least one selectable discrimination algorithm comprises a pluggable discrimination algorithm.

7. In a hierarchy of layered applications and corresponding protocols, a port and protocol sharing method comprising the steps of:

receiving traffic over a single shared logical port and routing said traffic to an interlayer communications process disposed between two layers in the hierarchy;

selecting a particular application/protocol layer in a higher one of said two layers to which said traffic is to be routed; and,

routing said traffic to said selected particular application/protocol layer.

8. The method of claim 7, further comprising the steps of

further selecting a subsequent application/protocol layer in a higher one of two other layers to which said traffic is to be routed; and,

routing said traffic to said further selected particular application/protocol layer.

9. The method of claim 7, further comprising the steps of:
 - adding an additional application/protocol layer to the hierarchy;
 - considering said additional application/protocol layer in said selecting step; and,
 - when selected, routing said traffic to said additional application/protocol layer.
10. The method of claim 7, wherein said selecting step comprises the step of selecting a particular application/protocol layer based upon at least one attribute of said particular application/protocol layer selected from the group consisting of a number of layers of application processes and protocols disposed within the hierarchy above said interlayer communications process, a weighting of said application processes and protocols; a catch-all to handle individual ones of said applications and protocols which are not selective in nature, previous context characteristics for said applications and protocols, and overall system characteristics.
11. A method for augmenting a hierarchy of layered applications and corresponding protocols, the method comprising the steps of:
 - applying a discrimination algorithm to a selection process in which a particular application/protocol layer in a listing of adjacent application/protocol layers is selected to receive traffic flowing through the hierarchy;
 - inserting a new application/protocol layer adjacent to said particular application/protocol layer in the hierarchy;

adding said new application/protocol layer to said listing; and,
replacing said discrimination algorithm with another discrimination algorithm
programmed to consider said new application/protocol layer during said selection
process.

12. The method of claim 11, further comprising the steps of performing said inserting,
adding and replacing steps without decoupling or disabling other applications and
protocols in the hierarchy.

13. The method of claim 11, wherein said applying step comprises the step of
applying said discrimination algorithm to select a particular application/protocol layer
based upon at least one attribute of said particular application/protocol layer selected
from the group consisting of a number of layers of application processes and protocols
disposed within the hierarchy, a weighting of said application processes and protocols;
a catch-all to handle individual ones of said applications and protocols which are not
selective in nature, previous context characteristics for said applications and protocols,
and overall system characteristics.

14. A machine readable storage having stored thereon a computer program for port
and protocol sharing in a hierarchy of layered applications and corresponding protocols,
the computer program comprising a routine set of instructions which when executed
cause the machine to perform the steps of:

receiving traffic over a single shared logical port and routing said traffic to an interlayer communications process disposed between two layers in the hierarchy; selecting a particular application/protocol layer in a higher one of said two layers to which said traffic is to be routed; and, routing said traffic to said selected particular application/protocol layer.

15. The machine readable storage of claim 14, further comprising the steps of further selecting a subsequent application/protocol layer in a higher one of two other layers to which said traffic is to be routed; and, routing said traffic to said further selected particular application/protocol layer.
16. The machine readable storage of claim 14, further comprising the steps of: adding an additional application/protocol layer to the hierarchy; considering said additional application/protocol layer in said selecting step; and, when selected, routing said traffic to said additional application/protocol layer.
17. The machine readable storage of claim 14, wherein said selecting step comprises the step of selecting a particular application/protocol layer based upon at least one attribute of said particular application/protocol layer selected from the group consisting of a number of layers of application processes and protocols disposed within the hierarchy above said interlayer communications process, a weighting of said application processes and protocols; a catch-all to handle individual ones of said

applications and protocols which are not selective in nature, previous context characteristics for said applications and protocols, and overall system characteristics.

18. A machine readable storage having stored thereon a computer program for augmenting a hierarchy of layered applications and corresponding protocols, the computer program comprising a routine set of instructions which when executed cause the machine to perform the steps of:

applying a discrimination algorithm to a selection process in which a particular application/protocol layer in a listing of adjacent application/protocol layers is selected to receive traffic flowing through the hierarchy;

inserting a new application/protocol layer adjacent to said particular application/protocol layer in the hierarchy;

adding said new application/protocol layer to said listing; and,

replacing said discrimination algorithm with another discrimination algorithm programmed to consider said new application/protocol layer during said selection process.

19. The machine readable storage of claim 18, further comprising the steps of performing said inserting, adding and replacing steps without decoupling or disabling other applications and protocols in the hierarchy.

20. The machine readable storage of claim 18, wherein said applying step comprises the step of applying said discrimination algorithm to select a particular

application/protocol layer based upon at least one attribute of said particular application/protocol layer selected from the group consisting of a number of layers of application processes and protocols disposed within the hierarchy, a weighting of said application processes and protocols; a catch-all to handle individual ones of said applications and protocols which are not selective in nature, previous context characteristics for said applications and protocols, and overall system characteristics.
